

Lab 1 - Use-Case Flow Specification

UC-01: Ingest Incident Alert | PES1UG24AM920

Preconditions: on-call schedule and escalation policy are configured; monitoring integration is active.

Postconditions: incident is stored; a notification is sent; final state is acknowledged or escalated.

Main Success Scenario

1. Monitoring system sends an incident alert to the webhook endpoint.
2. System validates the alert and creates an incident record.
3. System checks the on-call schedule and finds the current Tier-1 engineer.
4. System reads the escalation policy and selected notification channels.
5. System sends the alert to the Tier-1 engineer.
6. The engineer acknowledges the incident from the dashboard, SMS, or phone.
7. System records the acknowledgement and stops the escalation timer.
8. The incident remains available for investigation until it is resolved.

Alternate Flow - Acknowledgement Timeout

1. The 5-minute timeout expires without acknowledgement.
2. System marks the incident as escalated and selects the Tier-2 engineer.
3. System notifies Tier-2 and informs the Incident Commander.
4. When Tier-2 acknowledges, the timer is stopped and the incident continues normally.
