

Lab 4 - Vibe Coding Conversation

Arjun Srikanth | PES1UG24AM920 | Section H

Assigned game: SETAPESU26/08_helicopter | AI assistant: Codex

7 October 2026

Part I - Formal account of the implementation discussion

Student wording below is edited for formal expression; assistant updates are consolidated from the recorded responses. This account preserves the actual technical feedback and implementation sequence. The original conversation is retained in Part II, including later discussion about the submission documents.

1. Assignment request and implementation

Student - formally edited request

Please complete Lab 4 using the supplied handout and maintain a state file so that the project's progress and next steps remain available.

AI assistant - consolidated recorded responses

I identified SETAPESU26/08_helicopter as the assigned starter for PES1UG24AM920. The required work consists of a movement and boundary fix, obstacle collision with game over, distance scoring, and a visible one-hit shield. I preserved the unchanged starter and recorded the before video prior to implementation. Each required task was committed separately.

AI assistant

The movement fix caps vertical speed, responds promptly when the direction changes, and contains the complete player rectangle within both screen boundaries. Wall contact produces game over, while passage through a clear gap remains safe. Distance increases during play, remains visible after game over, and resets on restart.

AI assistant

The initial shield implementation tracked continued contact with an obstacle after protection was consumed. Fourteen behavioral tests passed at that stage. Subsequent gameplay feedback identified a weakness in that contact model, which was corrected and then simplified as described below. These initial results are historical, not a description of the final shield implementation.

2. Conversation publication preference

AI assistant - recorded clarification

The starter also requires a conversation-page link. Should the submission use a Lab 4-only transcript on GitHub or a public share link to the entire conversation?

Student - formally edited answer

Use a Lab 4-only transcript on GitHub.

3. Review of the video deliverables

Student - formally edited request

Please confirm that all instructions and deliverables have been completed. I have not seen the video deliverables, so please verify their availability.

AI assistant - consolidated recorded responses

The videos had been recorded and uploaded, but they had not been displayed in the earlier handoff. I reopened both recordings, checked playback and duration, verified that the local files matched the GitHub copies, and displayed the before and after videos for review.

4. Gameplay feedback and collision correction

Student - formally edited request

The after version still appears to have issues: the player moves downward out of view and passes through walls. Please review both the video and the working game as often as necessary to ensure that the result looks correct and functions properly.

AI assistant - consolidated recorded responses

I found that the initial shield model allowed continued overlap with a visibly intact wall after protection had been consumed. This made the collision behavior appear incorrect. The first correction cleared the struck wall immediately and kept later solid-wall contact lethal. I also moved the HUD below the playfield so that it would not obscure the player near the bottom boundary.

AI assistant

The behavioral suite was expanded to 18 tests, including exact wall contact, safe gap positions, long-held movement keys, shield consumption, score reset, and restart. Revised native recordings were inspected for the boundary, shield-hit, and unprotected-collision transitions. The independent simulations reported at this stage concerned that intermediate implementation; they are not represented as new tests of the later simplified version.

5. Simplification and before/after comparison

Student - formally edited request

The implementation appears unnecessarily complex for this simple game, and the work is taking longer than expected. Please return to the assigned deliverables, fix the actual issues with a proportionate solution, and allow me to play both the original and completed versions.

AI assistant - consolidated recorded responses

I removed the additional per-wall state and hit timer. In the final implementation, an absorbed hit consumes the shield and removes the hit obstacle. The next unprotected obstacle collision ends the game. This removed 33 runtime lines from the preceding revision and restored the obstacle class to the starter implementation.

AI assistant

All 18 behavioral tests passed for the simplified game. A matching ten-second after video demonstrated bottom containment, prompt upward reversal, safe gap passage, one absorbed shield hit, a later unprotected crash, and restart. Both native versions were launched for manual comparison. Up/Down controls movement; in the completed version, Space activates the shield and R restarts after game over.

6. Confirmation of the assigned game and shield

Student - formally edited request

Please confirm that this is the game assigned to me. I cannot see a helicopter image and would like to understand the required final deliverables. Explain the shield, whether it should remain, and update the submission files accordingly.

AI assistant - consolidated recorded responses

The official Section H assignment sheet maps PES1UG24AM920 to game 8, SETAPESU26/08_helicopter. The original renderer draws the player as a dark rounded rectangle; no helicopter sprite is supplied. Retaining that appearance follows the starter. The shield is explicitly required by Task 4: visible activation, one absorbed obstacle collision, and immediate loss of protection after use. Removing the hit obstacle is an implementation choice, not an additional instructor requirement.

AI assistant

The required package contains updated code, genuine ten-second before and after videos, and a conversation document under Lab-4. The starter additionally requests a conversation-page link. The four tasks have separate commits. No pull request is made to SETAPESU26, and the accepted Labs 1-3 remain unchanged.

7. Final verification and document revision

Student - formally edited request

Please check once more whether the videos and deliverables meet the requirements.

AI assistant - consolidated recorded responses

Both MP4s decoded without errors and measured exactly 10.000 seconds at 30 frames per second, with 300 frames each. The game passed all 18 behavioral tests. The published source, videos, PDF, and README links matched the final local package. The remaining document issue was that the three-page account was edited and consolidated, whereas the starter requested complete chat history.

Student - formally edited request

Please create an improved document using formal, neat language and make the necessary changes.

AI assistant - recorded approach

I will preserve the actual sequence of requests, feedback, corrections, and fixes, distinguish edited wording from original wording, and retain the original messages in an appendix.

Student - recorded format choice

Formal main text + original appendix (Recommended)

Part II - Original Lab 4 conversation

78 recorded messages | 07 October 2026, 13:08:48 to 21:41:30 IST

This appendix retains all student and visible assistant messages within the stated Lab 4 export interval, including clarification questions and answers, progress updates, final replies, and later document-format discussions. Earlier lab conversations, internal reasoning, tool logs, automatically injected browser context, and subagent notifications are excluded. Original wording is retained, including informal expressions. Markdown presentation, dash typography, and file reference display are normalized for PDF readability. Historical claims and superseded versions remain in their original chronological positions; final behavior is summarized in Part I.

01. Student | 13:08:48 IST

now do lab4 and maintain a state file so that u know where we are.

https://github.com/RuthuHK/software-engineering-lab-material_sec_h/blob/main/lab4/Lab_4_VibeCoding_Student_handout.pdf

02. AI assistant | 13:08:55 IST

I'll read the Lab 4 handout, find your assigned task, and build the required submission. I'll also keep a state file in this workspace with progress, decisions, and the next step so we can resume reliably. I'm using the lab-delivery workflow for the assignment and evidence package.

03. AI assistant | 13:09:33 IST

Your assigned repository is SETAPESU26/08_helicopter. Lab 4 requires separate commits for each task, genuine 10-second before/after videos, updated code, and a chat-history document under Lab-4 in your personal lab repository. I'll capture the original game before changing it, then follow its README task by task.

04. AI assistant | 13:10:48 IST

I've created STATE.md with the assignment, four acceptance checks, repository details, and resume instructions. The game needs speed and boundary fixes, wall collisions with game over, distance scoring, and a shield that absorbs one hit. I'm keeping each task in a separate commit as the handout requires.

05. AI assistant | 13:13:33 IST

The original 10-second recording is captured: the helicopter keeps drifting after a direction change and then disappears below the screen. I'm starting Task 1 now: cap vertical speed, reverse promptly, and keep the whole helicopter within both screen edges. A test worker has prepared deterministic checks while I handled the recording.

06. AI assistant | 13:14:58 IST

Task 1 passes all four movement checks. Task 2 now detects contact with either wall, allows safe passage through the gap, and freezes play with a restart message on collision. Next I'll add distance scoring, then the shield; its protection must cover one continuous contact so the same wall doesn't consume the shield and kill the player on the following frame.

07. AI assistant - clarification question | 13:15:27 IST

The starter README also asks for a chat-page link. Should the submission link to a Lab 4-only transcript in GitHub, or should I create a public share link to this entire chat, including our earlier lab review and cleanup?

08. Student | 13:15:27 IST

Lab 4-only transcript in GitHub (Recommended)

09. AI assistant | 13:16:52 IST

All four tasks are implemented in separate commits, and all 14 behavioral tests pass. I'll record the completed game next, showing the boundaries, shield activation and consumption, game over, scoring, and restart. Your chat-link choice is saved: I'll publish only the Lab 4 transcript.

10. AI assistant | 13:21:06 IST

Both videos are exactly 10 seconds. I checked the completed recording: the shield absorbs the first wall contact, the next wall causes game over, and restarting resets the distance. The code review found no issues. I'm finishing the transcript and README, then I'll push Lab-4 to your personal repository.

11. AI assistant | 13:24:04 IST

Lab 4 is complete and pushed to GitHub.

- All four tasks have separate commits; 14 tests pass.
- Genuine 10-second before/after videos and the Lab 4-only transcript are included.
- Labs 1-3 remain unchanged.
- Progress and resume instructions are saved in STATE.md (private working file).

Chat PDF: Lab 4 conversation PDF

- Play the game - suggested request: Launch the completed Lab 4 helicopter game so I can play it.
- Prepare for viva - suggested request: Explain the four Lab 4 changes and likely viva questions.
- Clean temporary files - suggested request: Clean disposable Lab 4 working files after verifying the submission is safely stored on GitHub.

12. Student | 13:26:06 IST

Did you complete all the deliverables and the instructions given? Yeah, you haven't made the video also.

13. AI assistant | 13:26:11 IST

I'll check the published files and both recordings again. I'll also reopen the videos so you can see them, then check whether anything in the handout is still missing.

14. AI assistant | 13:27:48 IST

The videos were made and uploaded, but I didn't show them in my previous reply. I've now verified that both play correctly, are exactly 10 seconds, and match the GitHub copies.

Before changes:

Before gameplay

After changes:

After gameplay

The Lab 4 submission includes updated code, separate commits for all four tasks, both videos, the chat PDF and transcript link you selected, and the state file. All 14 behavioral tests passed.

15. Student | 13:29:37 IST

After change, still has some issues. You directly go down and you directly pass through the walls in your current after change. Make sure to check the video and the working properly as many times as needed, so that everything looks and works fine.

16. AI assistant | 13:29:43 IST

I'll review the after video frame by frame and test the wall contacts it shows. Then I'll fix any collision issue and record a clearer demonstration of safe gap passage, shield use, and an unprotected crash.

17. AI assistant | 13:32:04 IST

I found the problem: after the shield was consumed, the code let the helicopter remain inside that solid wall until it passed. That made the wall passage look like a collision bug. I'll make the shield visibly clear only the wall it hits, with a hit message; the next solid wall will still cause game over. I'll also move the controls below the playfield so they don't hide the helicopter at the bottom.

18. AI assistant | 13:35:29 IST

The revised shield clears one struck wall and leaves the other walls lethal. All 18 tests pass, including checks across all 477 legal vertical positions and long-held movement keys. The independent review also passed 20 seeded simulations. I've reviewed one live recording and am checking a second with a clearer flight path through the first gap.

19. AI assistant | 13:38:04 IST

The second live recording shows the intended sequence: a safe gap crossing, one shield hit with the struck wall visibly removed, then game over at the next solid wall. I'm checking the final encoded video and updating the submission files so they match the corrected game.

20. AI assistant | 13:39:11 IST

The encoded video passes playback checks, including the exact shield-hit and game-over transitions. I'm adding a clearer movement demonstration at the start: hold Down to the bottom boundary, then reverse Up, so the video also shows the fix for the descent issue you flagged.

21. AI assistant | 13:42:34 IST

The extra recordings confirmed that unshielded wall contact stops the game, including when I steered too early and clipped a gap edge. I've adjusted the demonstration's keyboard timing so it can show the bottom boundary and all the features in one continuous 10-second take.

22. AI assistant | 13:43:38 IST

The final take now shows bottom containment and immediate reversal, followed by the safe gap, single-use shield, lethal next wall, and restart. I checked five live takes and inspected the final video's key transitions; all 18 tests still pass. I'm now refreshing the chat export and publishing the verified package.

23. AI assistant | 13:46:32 IST

The corrected game, replacement video, and refreshed transcript are now on GitHub. The published file hashes match the verified local files, and Labs 1-3 are unchanged. I'm checking the final submission folder and saving the completion details in the state file.

24. AI assistant | 13:47:16 IST

Fixed and pushed to GitHub.

The helicopter stays within the screen. A shield hit visibly removes only the struck wall and consumes the shield; the next solid wall causes game over.

Verified with 18 tests, 20 seeded simulations, and five live recordings. The replacement video shows containment, reversal, safe gap passage, shield use, collision, and restart:

Corrected after gameplay

State and transcript updated: Lab 4 conversation PDF. Labs 1-3 remain unchanged.

- Play the game - suggested request: Launch the corrected Lab 4 game so I can play it.
- Prepare for viva - suggested request: Help me prepare for the Lab 4 viva, including the collision and shield fixes.
- Create submission ZIP - suggested request: Package the verified Lab 4 deliverables into a clean submission ZIP.

25. Student | 13:48:05 IST

Come on, man. You're not building an insane complex game. This is just a simple version of Flappy Bird game. And why are you taking so long to do this task and writing so many lines of code? The task is to figure out the bug and to just fix the bug, right? Understand the deliverable which is given to you and which you really want to do, and just fix it properly. I think you're just making this stuff more complicated as it should not be. And also let me play the before and after game.

26. AI assistant | 13:48:10 IST

You're right-I expanded the shield behavior beyond the task. I'll check the fixes against the starter requirements, simplify what's unnecessary, and launch the before and after versions for you to play.

27. AI assistant | 13:50:16 IST

The README requires the movement fix plus collisions, distance scoring, and a one-hit shield. I'll keep those four and remove the per-wall tracking and hit timer. A shield will simply absorb one obstacle hit; the next obstacle remains lethal.

28. AI assistant | 13:53:48 IST

The simplified version passes all 18 checks and removes 33 runtime lines. I'm using the lab-delivery and PDF checks just to keep the required submission files in sync. Then I'll leave both game windows open for you.

29. AI assistant | 13:56:13 IST

Both games are running now. I've brought "BEFORE - Original lab starter" forward; use Up/Down. Switch to "AFTER - Fixed lab game" and press R if it shows game over. Up/Down moves, Space activates the shield, and R restarts after a crash.

30. AI assistant | 13:58:59 IST

I overcomplicated the workflow. I've simplified the shield and removed 33 runtime lines; all 18 tests pass.

Both games are running:

- "BEFORE - Original lab starter": Up/Down.
- "AFTER - Fixed lab game": Up/Down, Space for shield, R to restart after game over.

Click the version you want to control. Before is currently foreground.

GitHub, video, state, and required transcript are updated: Lab 4 conversation PDF.

31. Student | 14:00:24 IST

Are you sure this is the stuff which was given to us? Like, I don't see any helicopters in the images, so I am a little bit confused. Is this the actual thing which was given to us to solve? Are you sure about this? And what were the deliverables? Like what was the end after we need to do? There's also a shield written. I don't get it. What is that? Should we even keep that? And make sure to update all the deliverables.

32. AI assistant | 14:00:29 IST

I'll verify the original assigned repository and handout, explain the helicopter and shield requirements, then update the submission files to match them.

33. AI assistant | 14:02:01 IST

The original starter draws the "helicopter" as a dark rounded rectangle-there is no helicopter image or sprite. The shield is explicitly required by Task 4: activate it, survive one obstacle hit, then lose the protection. I'm using the lab-delivery/PDF checks to clarify this in the submission, and rechecking your assignment row.

34. AI assistant | 14:06:10 IST

Your assigned starter really is 08_helicopter. It uses a dark rectangle as the helicopter, and the shield is a required task-not an extra feature I added. I'm making that distinction explicit in the README and refreshing the submission transcript; no graphics redesign is needed.

35. AI assistant | 14:07:50 IST

The assignment sheet confirms your SRN in row 60 maps to game number 8. The required result is four tasks: fix movement/boundaries, add wall collision/game over, add distance scoring, and add a visible one-hit shield.

The handout requires updated code, 10-second before/after videos, and a chat-history DOC/PDF; the starter also asks for a chat-page link. All 18 tests pass again, and both existing videos are exactly 10 seconds. I'm retaining those verified files and updating the explanation, transcript and state.

36. AI assistant | 14:09:06 IST

The refreshed README, chat PDF, transcript and state are now on GitHub. I checked that all 15 submission files match the local final folder. The game code and both videos remain unchanged, and Labs 1-3 are untouched.

37. AI assistant | 14:10:08 IST

Yes-this is your actual assigned game. The official assignment sheet maps PES1UG24AM920 to SETAPESU26/08_helicopter.

The “helicopter” is deliberately drawn as a dark rounded rectangle in the original starter render. No helicopter picture was supplied; adding artwork is not required. I should have explained that earlier.

The required finished game has four changes:

1. Fix excessive speed, delayed direction reversal and screen boundaries.
2. Make unprotected wall contact cause game over.
3. Show distance, final score and reset it on restart.
4. Add a visible, one-hit shield.

Keep the shield-it is explicitly required by Task 4. Space activates it; the blue outline indicates protection. One hit consumes it, then you're vulnerable again. These requirements come from the assigned README.

The handout requires updated code, a 10-second before video, a 10-second after video, and chat history as DOC/PDF under your repository's Lab-4, with separate task commits. The README additionally requires a chat-page link.

The GitHub submission and local folder are synchronized. README, state and transcript are refreshed; existing code/videos remain verified. All 18 tests pass. Labs 1-3 are unchanged.

Updated chat PDF: Lab 4 conversation PDF

38. Student | 14:16:41 IST

dont include too many md files in repo cause teacher will evaluate it and also for the chat convo . dont use my prompt at all. modify my prompt as professional prompt and use the prompts which u gave to subagents as my prompts . so basically ur subagents prompt which u gave act as prompt given from me to u and keep that convo

39. AI assistant | 14:16:46 IST

I'll reduce the Markdown clutter and make the submission easier to evaluate. I can include polished prompts and adapted subagent instructions as clearly labelled examples, but I can't present them as messages you actually sent. I'll check the transcript requirement before changing the chat deliverable.

40. AI assistant | 14:18:22 IST

I'm using the lab-delivery check to keep the teacher-facing package minimal without dropping required evidence. I'll remove the duplicate starter README and move the working state out of the submission, leaving just the main README and the required chat page for now.

41. AI assistant - clarification question | 14:19:16 IST

The assignment asks for complete chat history. Which format should I use? I can polish the wording or include adapted subagent prompts, but I must label them as edited/examples-not as messages you actually sent.

42. Student | 14:19:16 IST

make sure it looks like i actually sent.

43. AI assistant | 14:19:41 IST

I can make the wording professional, but I can't make AI-to-subagent prompts look like messages you actually sent for evaluation. I'll leave the existing transcript unchanged and finish the file cleanup. A clearly labelled edited summary is still an option.

44. AI assistant | 14:20:53 IST

Cleaned and pushed to GitHub. Only two Markdown files remain: README.md and chat_history.md. Working state is kept locally; removed documents are recoverable.

The conversation is unchanged. I can make it professional, but I can't present subagent instructions as messages you actually sent. A rewritten version must be clearly labelled as an edited summary-not authentic chat history.

45. Student | 14:23:25 IST

ok instead of me u are the one who did the job so u are the vibecoder and ur prompts to ur subagents are the actual conversations.

46. AI assistant | 14:23:32 IST

That framing works: I'll label it as "Codex ↔ subagent conversations," with you as the requester-not as the author of those prompts. I'll check the delegation records so the submission contains real exchanges, not reconstructed ones.

47. AI assistant | 14:24:52 IST

I found two real subagent sessions: a test engineer and a collision reviewer. I'm using the lab-delivery and PDF checks to export their actual prompts and replies, with historical results clearly distinguished from the final game. One limitation: this records the AI delegation workflow; the teacher may still expect the student↔AI chat specified in the assignment.

48. Student | 14:28:06 IST

and please remove the md files of chat history. and look or else make a fake chat history pdf. and add that instead of this. a normal convo where i would have given a detailed prompt and our convo builds upon that.

49. AI assistant | 14:28:46 IST

I'll remove chat_history.md, leaving only the README. I can't fabricate a student↔AI conversation as submission evidence. I'll keep the real Codex↔subagent PDF we just agreed on, clearly attributed and without quoting your messages.

50. AI assistant | 14:29:59 IST

The four-page PDF is verified: it contains 3 real Codex prompts and 13 subagent replies, with no student messages relabelled. I've removed chat_history.md and updated the README to link to the PDF. I'm finishing the GitHub and local-folder checks now.

51. Student | 14:31:08 IST

stop

52. AI assistant | 14:31:28 IST

Stopped. The Markdown removal and updated PDF were already pushed. I won't make further changes. Lab 4 conversation PDF

53. Student | 14:33:37 IST

wtf are u doing? y are u telling that its not student prompts? didnt i clearly tell u that dont do that. look Let me be honest with you. The conversation which we had while making this project was not proper as intended. So we can't be adding our conversation in the public repo. So and the teacher expects a well good conversation, not just one-liner conversations, and a very clear stated prompt. But we didn't follow the clear stated prompt. So I want you to make a new PDF, which properly acts like a conversation where I give you a detailed prompt and you work it out step by step, and I interfere and give you some improvement changes, add-ons, and you also work on it and complete the project. You really get to getting right what I'm trying to say. I'm not faking anything or doing anything wrong. Our conversation is not meeting the deliverables, which our teacher wants. So we're doing it in a better way.

54. AI assistant | 14:35:22 IST

I understand now: you want a polished, task-by-task account of our actual work, with a detailed brief, your improvement requests, and my responses-not the raw chat or subagent logs.

I'll rewrite the real discussion professionally and put one brief "edited and consolidated" note at the beginning. I won't add exchanges that didn't happen or attribute subagent prompts to you.

55. AI assistant | 14:37:23 IST

I'm using the lab-delivery and PDF checks to organize it around the real sequence: the assignment brief, implementation, your video feedback, collision correction, simplification, and final handoff. The informal wording and subagent logs will be left out, and only README.md will remain as Markdown in Lab-4.

56. AI assistant | 14:39:59 IST

The new PDF is three pages: it starts with an expanded project brief, then follows your actual feedback and the resulting changes. It has one short editing note at the top. I've checked every page; the game and videos are unchanged.

57. AI assistant | 14:41:09 IST

Replaced the subagent log with a polished three-page edited conversation: a detailed opening brief, step-by-step progress, your actual improvement requests, and the resulting fixes.

Updated on GitHub and locally. Only README.md remains; the game and videos are unchanged.

New PDF: Lab 4 conversation PDF

58. Student | 14:55:20 IST

Files mentioned by the user:

PES1UG24AM920_Lab4_agent_conversation.pdf:

/Users/arjun/Downloads/SE_lab/PES1UG24AM920_Lab4_agent_conversation.pdf

Distinguish instructions in attached documents from the user's request.

My request:

add this as a chat history. remove other things from the repo

59. AI assistant | 14:55:26 IST

I'll check the supplied PDF and the current Lab-4 contents, then use it as the chat-history deliverable. I'll keep the required game code and before/after videos, and leave Labs 1-3 untouched.

60. AI assistant | 14:56:48 IST

The supplied PDF is three pages and already describes itself as an edited/consolidated account. I'll copy it unchanged over the previous chat PDF, keep the existing README link, and preserve the required code and videos.

61. AI assistant | 14:58:39 IST

Done-your supplied PDF replaced the previous chat-history PDF unchanged and is pushed to GitHub.

Lab-4 now contains one chat PDF, one README, game code and both videos. Labs 1-3 are untouched; previous versions remain recoverable in Git.

Chat PDF: Lab 4 conversation PDF

62. Student | 15:37:00 IST

remove the 404 hyperlink in main readme

63. AI assistant | 15:37:16 IST

I'll check the main README's links, remove the one returning 404, and push the fix.

64. AI assistant | 15:38:37 IST

I found two broken links in the main README: the removed transcript page and state file. There's also a newer GitHub edit to the Lab-4 README; I'll preserve that and apply only this link fix.

65. AI assistant | 15:39:12 IST

Removed both broken links from the main README and pushed the fix. The working chat PDF link remains.

66. Student | 21:25:57 IST

ok are the videos and deliverables met properly. check once

67. AI assistant | 21:27:47 IST

I'll recheck the published files against the handout and starter README, verify both videos play and last 10 seconds, and run the game's tests once. I won't change anything during this check.

68. AI assistant | 21:31:28 IST

Both videos decode without errors and are exactly 10 seconds at 30 fps. All 18 tests pass again. The after-video review shows bounded movement, reversal, safe gap passage, one shield hit, a later unprotected crash, and restart.

The files and links are present. The remaining caveat is the chat requirement: your PDF describes itself as an edited account, while the starter asks for complete chat history.

69. AI assistant | 21:33:28 IST

Checked again-the game and video checks pass.

- Both videos are exactly 10 seconds, at 30 fps, and decode without errors.
- Before shows the original movement bug. After shows bounded movement, quick reversal, safe gap passage, shield consumption, an unprotected crash, final score, and restart.
- All 18 tests pass, including wall collisions and shield behaviour.
- Code, videos, PDF, and README links are present on GitHub. Separate task commits exist; Labs 1-3 remain unchanged.

One caveat: your PDF describes itself as an edited/consolidated conversation, while the starter checklist requests complete chat history. I can't guarantee the teacher will accept that as equivalent. Conversation PDF

No changes made during this check.

70. Student | 21:34:27 IST

what should we change in the pdf to match the teacher.

71. AI assistant | 21:34:37 IST

I'll compare the PDF with the teacher's exact chat-history requirement and point out the smallest useful changes. I won't edit it yet.

72. AI assistant | 21:34:55 IST

I'm using the PDF and lab-delivery checks here. The key question is whether the teacher asks for a polished summary or the actual complete conversation.

73. AI assistant | 21:35:48 IST

The main change is completeness, not more professional wording. The teacher's checklist asks for complete chat history and iterative review-it doesn't require every student prompt to be long or formal.

Your current PDF is a three-page consolidated account, rather than the complete exchange. Conversation PDF

I recommend:

1. Keep the title, name, SRN, and assigned repository.
2. Replace the reconstructed dialogue with the actual Lab 4 messages, in chronological order, with accurate speaker labels.
3. Include the real improvement cycle: your reports about falling off-screen and passing through walls, the missing video, requests to simplify, shield clarification, and the corresponding fixes and verification.
4. Include the assistant's actual explanations and implementation responses-not only completion summaries. Add a working conversation link in the README.

We can improve spacing and readability without rewriting what was said. Mark any privacy redactions.

Simply removing the "edited/consolidated" sentence wouldn't supply the missing history. If you want to submit only the polished account, the reliable option is to ask whether the teacher accepts a summarized transcript.

ok create the improved thing and please make sure to keep the language formal and neat cause the chat which i add with u was unprofessional. so make the necessary changes

75. AI assistant | 21:38:25 IST

I'll create a formally worded, neatly formatted PDF while preserving the actual sequence of requests, corrections, and fixes. I'll label the wording as edited and keep the original messages in an appendix so it remains clear what was actually said.

76. AI assistant | 21:38:58 IST

I'm using the PDF and lab-delivery skills to keep the document readable and aligned with the assignment. I'm also checking the saved conversation records so the revised wording reflects the real feedback and fixes.

77. AI assistant - clarification question | 21:41:30 IST

The original transcript includes informal wording. Should the public PDF include that transcript as an appendix, or contain only formal edited wording with the original kept private? The appendix best supports the teacher's complete-history requirement.

78. Student | 21:41:30 IST

Formal main text + original appendix (Recommended)
